NP-H has an important function in mature axons that is not subserved by the two smaller NF proteins. Perfer There are a number of repeats of the tripeptide K-S-P, NFH is phosphorylated on a number of the serines in this motif. It is thought that phosphorylation of NFH results in the formation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        interfilament cross bridges that are important in the maintenance of axonal caliber.

of axonal caliber.

The Phosphorylation seems to play a major role in the functioning of the larger neurofilament polypeptides (NF-M and NF-H), the levels of phosphorylation being altered developmentally and coincident with a change in the neurofilament function.

SIMILARITY: Belongs to the intermediate filament family.

CAUTION: Ref. i sequence differs from that shown due to a frameshift in position 783.
                                                                                                                                                                                                                                                                                                                                                                                                                                    MEDLINE=89184647; PubMed=2928342;

calcium and contains a leucine zipper.";

Proc. Natl. Acad. Sci. U.S.A. 90:1536-1540(1993).

-!- FUNCTION: Might function as a calcium-sequestering "sponge" to regulate the amount of free cytoplasmic calcium. It binds 0.3 and of Calca+ per mole of protein.

-!- SUBGNIT: Homodimer (Probable).

-!- SUBCELLULAR LOCATION: Cytoplasmic; hypodense compartment.

-!- TISSUE SPECIFICITY: Somm and axons of photoreceptor cells of compound eyes and ocelli.

-!- DEVELOPMENTAL STAGE: Expressed early in photoreceptor cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                BECI YEAST STANDARD; PRT; 1157 AA.

R. Analysis of the mouse transcriptome based on functional annotation of Nature 420:563-573(2002).

C. FUNCTION: Binds phospholipid vesicles containing phosphatidylinositol 3-phosphate and participates in endosomal trafficking (By similarity).

C. SUBUNIT: Homodimer. Binds STX6. Binds RABSA RABSE RABSC and RABSA that have been activated by GTP-binding (By similarity).

C. SUBCRLUMAR LOCATION: Cytoplasmic and peripheral membrane protein associated with early endosomes (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This SWISS-PROT entry is copyright. Clathrin coat assembly protein AP180 (Clathrin coat associated protein AP180) (91 kDa synaptosomal-associated protein Pl-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TISSUE SPECIFICITY: Brain. Associated with the synapses.

DEVELOPMENTAL STAGE: Developmentally regulated in a pattern coincident with active synaptogenesis and synaptic maturation. DOMAIN: Possesses a three domain structure: the N-terminal 300 residues harbor a clathrin binding site, an acidic middle domain 450 residues, incernupted by an Ala-rich segment, and the C-terminal domain (166 residues).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SIMILARITY: Contains 1 epsin N-terminal homology (ENTH) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mus musculus (Mouse).

(PHAA) PHARMACIA & UPJOHN AB Troyanovsky B; Holmgren L,

WPI; 2000-106099/09.

Novel human protein useful for treating angiogenesis associated diseases or disorders.

Claim 6; Page 49; 58pp; English.

The present sequence represents the angiostatin-binding domain, designated Big-3, of a human angiogenesis-associated protein. The protein binds an N-terminal fragment of plasminogen. The ABP-1 protein is designated ABP-1, and binds the first 4 kringle domains (KI-K4) and/or kringle 5 (K5) of plasminogen. These four kringle domains comprise angiostatin. The ABP-1 protein acts as a receptor for plasminogen. A polymorphic variant of ABP-1 is also described, in AAV54053. ABP-1 can be used to manufacture medicaments for treating angiogenesis-related

```
arthritis, and even some inflammatory diseases such as psoriasis, chronic inflammation of the intestine, asthma, etc. The protein may also be able to treat and cure, or prevent, obesity. The ABP-1 DNA can be used in gene
diseases or disorders, such as tumor conditions, diabetes, rheumatoid
```

WPI; 2002-426278/45. N-PSDB; ABQ61209.

New polypeptides and their encoded proteins, useful as nutritional sources or supplements, or in gene therapy, particularly for treating wounds, Alzheimer's disease, amyotrophic lateral sclerosis, cancer or inflammation.

Claim 20; SEQ ID # 868; 357pp + Sequence Listing; English.

The invention relates to 446 newly isolated polynucleotide sequences. The activity of polynucleotides of the invention may be described as, volnerary, neuroprotective, immunomodulator, cytostatic and anti-inflammatory. Compositions comprising nucleic acids of the invention are useful for treating a mammalian subject, or as untritional sources or supplements. These are useful in gene therapy, particularly for treating wounds, burns or ulcers, Alzheimer's disease, Huntington's disease,

Novel human protein useful for treating angiogenesis associated diseases

Claim 4; Page 43-46; 58pp; English.

```
The present sequence represents a polymorphic variant of a human angiogenesis-associated protein which is able to bind an N-terminal fragment of plasminogen. The native protein, described in AMY54052, is designated ABP-1, and binds the first 4 kringle domains (KI-K4) and/or kringle 5 (X5) of plasminogen. These four kringle domains comprise angiostatin. The ABP-1 protein acts as a receptor for plasminogen. The angiostatin-binding domain of the ABP-1 protein is described in AAY54054. ABP-1 can be used to manufacture medicaments for treating angiogenesis-related diseases or disorders, such as tumor conditions, diabetes, related diseases or disorders, such as tumor conditions, diabetes, psorials, chronic inflammation of the intestine, asthma, etc. The protein may also be able to treat and cure, or prevent, obesity. The ABP-1 DNA can be used in gene therapy techniques

                                                                                                                                                                                                                                                                                                                                                                                                                      death (GGDD) proteins and polymucleotides encoding them. The sequences of the invention are useful in diagnosing, preventing and treating disorders associated with an abnormal expression or activity of GDDD such as neurodegenerative disorders (e.g. Parkinson's disease, Alzheimer's disease), muscular disorders (e.g. parkinson's disease, Alzheimer's endocrine disorders (e.g. diabetes, Grave's disease), cancers (e.g. leukaemia, cervical or breast cancers), immunological disorders (e.g. scleroderma, systemic lupus erythematosus, allorgies), gastrointestinal disorders (e.g. Crohn's disease), renal disorders (e.g. doodpasture's syndrome), infections (e.g. viral, bacterial, fungal, parasitic, protozoal, helminthic), cardiovascular disorders (e.g. atherosclerosis) protozoal, helminthic), cardiovascular disorders (e.g. atherosclerosis) and hepatic diseases (e.g. cirrhosis). The polymucleotides can be used to create humanised animals or transgenic animals to model human diseases. The invention is also used in gene therapy. The present sequence is human

the invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid cancillated by the antisense antisense antisense antisense the specification is inhibited by the antisense antisense nucleic acid; (3) an antibody capable of specifically binding antisense nucleic acid; (4) an antibody capable of specifically binding cap bytypeptide (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation, or that that inhibits cellular proliferation of an identifying a gene required for callular proliferation or the biological pathway required for proliferation required gene or its gene product lies or a gene on which the terecompound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a gene activity; (11) a culture comprising strains in which the gene compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent of the organism. The antisense nucleic acids are useful for proliferation of an organism. The antisense nucleic acids required for callular proliferation to isolate candidate molecules for rational for equired for proliferation to isolate candidate molecules for rational for equiring for proliferation in cells and every programs, or for screening homologous nucleic acids required for required for proliferation and the remember of surpersonal sequence is encoded by one of required for proliferation and the professed of the present sequence is encoded by one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            64 ATABAVSPAAGGIPAAASVASAAAVAPSAAAAAVQVAPAAPAVPAPAPALVPVPAPAAA 123

The present invention relates to a method for identifying candidate proteins in pathogens useful as anti-infectives. The invention discloses a computational method which involves the calculation of several sequence attributes and their subsequence manalysis results in the identification of outlier proteins in different pathogens. The method is useful for the identification of outlier proteins (e.g. virulence proteins, antigens or proteins used as drug targets) in pathogenic organisms. The method of the invention provides reproducible results as it does not depend on the variable biochemical characterisation of proteins. ABO23500-ABO23501 represent outlier proteins identified from different pathogenic organisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         159 КТАААКРААКРААКАААКРААК---КРААККТААКТААКРААКРААКРААКРАТАК

The present invention describes synthetic genes encoding plant gums and other hydroxyproline (Hyp)-rich glycoproteins (HRGPB) and the nucleic acids that encode them. The nucleic acids, proteins and methods from the present invention may be used to produce HRGPB, repetitive proline-rich proteins (RRPRP) and arabinoglactan-proteins (ARBPB) in plants via recombinant methodologies, Also described is the expression of synthetic genes designed from repetitive peptide sequences, such as glycoproteins (Including the peptide sequences of gum arabic glycoproteins (ARBS)730 to ABJS1849 and ABBP8401 to ABB78544 represent sequences used in the exemplification of the present invention

ACF12828 to ACF12947 encode the human cervical cancer marker proteins (I) given in ABR92047 to ABR92164. A higher level of expression of (I) than normal indicates the presence of cervical cancer. Also described: (1) a certor (II) containing (I); (2) a host cell (III) containing (I); and (3) assessing (M1) whether a patient is afflicted with cervical cancer, comprising comparing the level of expression of a marker in a patient's sample, and the normal level of expression of the marker in a patient's cample, and the normal level of expression of the marker in a control non-cervical cancer sample, where a significant increase in the level of expression of the marker in the patient's sample relative to that in the cervical cancer. (I) has cytostatic activity, and can be used in gene therapy and in vaccines. (I) is useful in detecting, characterising, characterising and treating human cervical cancers. (I) may also be used in various prognostic and diagnostic assays, pharmacogenomics and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid molecule useful for detecting, characterizing, preventing and treating human cervical cancers, in various prognostic and diagnostic assays, in pharmacogenomics and in monitoring clinical trials.

The present invention provides the protein and coding sequences of the human 070227 oncogene. This gene is found at the HPC1 region of chromosome 1. The sequences can be used in the diagnosis and identification of treatments for prostate cancer. The present sequence is
                                                                                                                                                                      Novel human prostate cancer marker gene termed as 07CG27 gene, useful for screening mutations in the gene in diagnosis of a predisposition to

```
The present invention relates to novel human sequences associated with mast cell activation (ACC80172-ACC80179 and ABR57558-ABR57565). The coding sequences are useful for diagnosing or treating allergic hypersensitivity, asthma, seasonal rhinitis, urticaria, atopic dermatitis or mastocytosis

The invention is useful in developmental biology and in elucidating cell signalling and cell.cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention
                                                                                                                                                                                                                                                                                 96
                                                                                                                                                                                                                                                  74
cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLi6176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
